EDUCATION

University of Washington – Tacoma — Tacoma, WA

Expected March 2028

B.A. Computer Science & Systems • Minor in Business

Relevant coursework: Programming Practicum (TCSS 305), Discrete Structures — both in progress

TECHNICAL SKILLS

Languages: JavaScript, Java, Python, HTML/CSS, SQL

Backend: Node.js, Express, REST API design, third-party API integration, caching, rate limiting

Frontend: Vanilla JS, responsive design, accessibility (ARIA), progressive enhancement

Tools & Infra: Git/GitHub, Netlify, Render, Cloudflare, Eleventy/Nunjucks, npm

EXPERIENCE

Freelance Web Developer — Gaspar Web Co, Tacoma, WA

Aug 2026 – Present

- Design, build, and maintain production websites for local service businesses on monthly retainer — sole developer from requirements through deployment and ongoing support.
- Shipped brightdetailswa.com (Eleventy, Nunjucks, Netlify) as the business's first website, replacing a Facebook-only presence with a data-driven build that keeps the phone number, hours, and pricing in a single source of truth.
- Built a CMS admin panel letting the non-technical owner update hours, pricing, and photos from her phone with no developer involvement.
- Implemented a responsive image pipeline emitting five width variants in JPEG and WebP, with a CDN transform path for owner uploads; eliminated layout shift by emitting intrinsic dimensions.
- Added abandoned-lead recovery using `navigator.sendBeacon` — gated on valid contact info, deduplicated per session, routed to a separate submission queue — and migrated the business to a new domain with forced 301 redirects preserving canonical and sitemap consistency.

Maintenance Technician — Thrive Communities, Tacoma, WA

Feb 2026 – Present

- Diagnose and repair plumbing, electrical, and appliance issues across a multi-unit residential portfolio while enrolled full time, balancing 24 hours per week against a full course load.
- Triage and prioritize incoming work orders, escalating to specialized contractors when scope requires.

PROJECTS

ShouldISlab — shouldislab.com | Node.js, Express, REST APIs, Vanilla JS

- Built and deployed a full-stack expected-value calculator that tells collectors whether professional card grading is financially worth it; live on Render behind Cloudflare on a custom domain.
- Integrated two third-party APIs for live sales comparables and population reports, derived per-grade outcome probabilities, and applied Wilson score confidence intervals to small-sample data.
- Designed an in-memory TTL cache around a measured upstream limit of 10 requests per 35 seconds — one verdict costs up to 7 upstream calls — making the app usable where it would otherwise rate-limit on the second lookup.
- Handled upstream 429s with a typed error that fails fast and surfaces a retry countdown rather than blocking the browser for a 34-second `Retry-After`.

ExplainMyCode — explainmycode2.netlify.app | Node.js, Express, Anthropic API

- Built a service that explains arbitrary code in plain English, with IP-based rate limiting, payload size caps, and input validation on the API layer.

ADDITIONAL EXPERIENCE

Team Sports Associate, Dick's Sporting Goods (Sep 2025 – Feb 2026) • Youth Sports Instructor, Seattle Mariners Camps (Jun 2023 – Aug 2025) • Football Operations Assistant, Linfield University (Sep 2023 – Nov 2024) • Volunteer Cabin Staff, The Goodtimes Project pediatric cancer camp (Jul 2025)
